

Soil Specimens Illustrate the Effects of Management Practices

After using the infiltration/runoff model for a month or so, the soil can be dried, dipped in a 50% solution of white glue and water, and dried again.

Make a mixture of 50 percent white glue and 50 percent water for dipping.

The result can be some very effective visual aids to illustrate how porous a soil with many living organisms can become, as compared to a soil which has few organisms as a result of tillage.
